

1985 SPEY VALLEY LOCH SURVEY

Loch name ... Loch an Glein ... Estate Rothiemurchus ... No. ... 8 ...
 Grid Reference ... NH 892075 ... Date surveyed Sept. 16th - 17th 85
 Loch size 46.2 ha. Altitude 255 m Secchi disk depth m
 Water colour clear ... Loch level up cm down cm
 Adjacent wetland Osc. marshy/boggy patch in bays

NH8037

<u>Substrate types</u>	<input checked="" type="checkbox"/> Sand (0.1 - 4mm diam.)
Bedrock	<input type="checkbox"/> Silt (< 0.1mm diam.)
Boulders (> 30cm max diam.)	<input type="checkbox"/> Organic mud
<input checked="" type="checkbox"/> Stones (5-30cm diam.) mainly /	<input checked="" type="checkbox"/> Peat
<input checked="" type="checkbox"/> Gravel (4-50mm diam.) ✓	<input type="checkbox"/> Artificial embankment

Uses and Damage

USE	AREA AFFECTED	DAMAGE
Water abstraction
Sewage inflow
Agricultural pollution
Tourism: edge trampling	N. corner nr. Visitor Centre	locally bare
litter
boating
Fishing	... all loch	minimal
Shooting
Others

Fauna

	Birds	Mammals	Molluscs	Dragonflies
Others	Slow worm	abundant		<i>Lestes sponsa</i>
	Lizard	Gymnidae		<i>Gerragma cyathigerum</i>
	Pike	pond skaters		<i>Rehina juncea</i>
		+ <i>Notonecta</i> sp	Conductivity : 40-50 S. scoticum PH : 6.9 minhos	<i>Sympetrum nigriceps</i>

LOCH AN EILEIN

This large loch (46.2 ha), is surrounded by native Scots Pine and Birch forest with small patches of plantation. There is an island mostly occupied by a ruined castle. The loch edge is almost entirely stony and exposed. In the sheltered bays the peat, sand and gravel support richer plant communities; Carex rostrata beds, Nymphaea alba and Potamogeton natans. The inflow from Loch Gamhna in the south adds some diversity. The SW bay has the most deep water vegetation with two other Potamogeton species. (P. berchtoldii and P. perfoliatus). There are local calcareous streams with Chara globularis in the NE.

Communities

Substrate	Depth	Species	
Stones	0-0.5m	Littorella uniflora	F-A
		Carex rostrata	LD
		Equisetum fluviatile	LF

Target Notes

- (i) Pool containing Carex rostrata, Eriophorum angustifolium, Eleocharis multicaulis, Juncus bulbosus, Potamogeton polygonifolius, Utricularia intermedia, Scorpidium scorpioides and Chara globularis.
- (ii) Pool with Sphagnum species dominating, but also Carex rostrata, Eriophorum angustifolium and patches of Potamogeton polygonifolius, Menyanthes trifoliata, Carex nigra.
- (iii) A system of small pools and several inflows with Carex rostrata and Potamogeton polygonifolius.
- (iv) Indented peat loch edge with inlets containing Utricularia vulgaris, P. natans, Menyanthes, Potentilla palustris, Equisetum fluviatile, Juncus bulbosus, P. polygonifolius and Eriophorum angustifolium at the edge. Flushes run down to the loch edge fed by springs.
